

Paging Service Coverage Area and Tips

Updated June 30, 2023, with loss of Parksville (Little Mountain) communications tower.

Coverage area is estimated as indicated on the map, and subject to EMF interference (proximity to other electronic, digital, or radio equipment), weather, and physical obstructions.

The shadow area is estimated and shows areas with no or unreliable coverage. Backup communications methods should be used in these areas.

Paging Tips

- Perform regular testing of your expected coverage (especially if new potential causes of interference are observed, e.g. new electronic equipment, and new buildings).
- Perform regular checks to ensure your pager is in good physical condition. For example, is your battery charged, and is the pager free of visible debris and damage.
- Never transmit sensitive, confidential, financial, or military information.
- Best practice with all communications technology is to have backup methods available.
